From the global geopolitical arena to the smart city, control over knowledge—particularly over data and intellectual property—has become a key battleground for the exercise of economic and political power. For companies and governments alike, control over knowledge—what scholar Susan

Strange calls the knowledge structure—has become a goal unto itself. The rising dominance of the knowledge structure is leading to a massive redistribution of power, including from individuals to companies and states. Strong intellectual property rights have concentrated economic benefits in a smaller number of hands, while the “internet of things” is reshaping basic notions of property, ownership, and control. In the scramble to create and control data and intellectual property, governments and companies alike are engaging in ever-more surveillance. The New Knowledge is a guide to and analysis of these changes, and of the emerging phenomenon of the knowledge-driven society. It highlights how the pursuit of the control over knowledge has become its own ideology, with its own set of experts drawn from those with the ability to collect and manipulate digital data. Haggart and Tusikov propose a workable path forward—knowledge decommodification—to ensure that our new knowledge is not treated simply as a commodity to be bought and sold, but as a way to meet the needs of the individuals and communities that create this knowledge in the first place. This book takes as its starting point the need to improve sustainability performance across the triple bottom line and reach global sustainable development goals. As such, it places sustainability at the heart of developing and explaining relevant theory, concepts and models in operations and supply chain management. Sustainable Operations and Supply Chain Management consolidates the tools, concepts and methods of operations and supply chain management relevant for reaching sustainable development goals. This book includes not only descriptions of the theories and models but also practical cases based on the most recent developments in different industry sectors, including user electronics, healthcare, fashion and energy. Relevant student exercises are also included for use in the classroom or in personal study. This book provides an ideal introduction for Bachelor or Masters-level students, whether they are on general management and business degrees, or are focused on areas such as engineering management, technology management or sustainability management.
