Management of the
Difficult and Failed Airway
Cambridge University
Press

In the past three decades,
the field of airway
management has made
significant progress.

Airway management is
the backbone of
anesthesiology, and we
have a responsibility to
disseminate the most up-
to-date information to our
colleagues on the front
lines and in all disciplines
that deal with airway
management. It is
essential that clinicians
become familiar with the
most recent

developments in
equipment and scientific
knowledge to allow the
safe practice of airway
management. As such,
this book provides the
latest updates on airway
management in particular
circumstances and
highlights recent
advances in evidence-
based airway
management.

Principles of Airway Management LWW

Successful airway management demands strict attention to anatomic detail and the ability to tailor management strategies to each patient's illness and presentation. With the Atlas of Airway Management, readers will discover a clinically focused, abundantly illustrated guide to relevant anatomy, as well as the latest tools and proven techniques in the field. The Second Edition of this respected resource

presents an improved and enlarged text—along with new sections on pediatric applications, bronchoscopy, special airway considerations in the emergency room and the ICU, and post-intubation care issues. Coverage of new and emerging techniques includes material on noninvasive ventilation and high-frequency jet ventilation.

Most patients with critical cardiac or thoracic

conditions will at some stage pass through the cardiothoracic critical care unit. Critical care presents more complex clinical data than any other area of medicine. Continuous monitoring makes diagnosis easy and further information can be easily obtained via a variety of diagnostic tools. Core Topics in Cardiothoracic Critical Care will guide clinicians from all disciplines in the management of cardiothoracic patients, demystifying the critical care unit and providing

the key knowledge in a concise and accessible manner. The central section is a detailed discussion of the management of each physiologic system; additional sections cover admission, general considerations in cardiothoracic critical care, procedure-specific care, discharge and follow-up, structure and organization of the unit, and ethical and legal issues. All aspects of the overall care of the critically ill cardiothoracic patient are explained

concisely and comprehensively by experts in the field.

Originally published in 2005, *Core Topics in Pain* provides a comprehensive, easy-to-read introduction to this multi-faceted topic. It covers a wide range of issues from the underlying neurobiology, through pain assessment in animals and humans,

diagnostic strategies, clinical presentations, pain syndromes, to the many treatment options, for example, physical therapies, drug therapies, psychosocial care and the evidence base for each of these. Written and edited by experts of international renown, the many concise but comprehensive chapters provide the reader with a guide to all aspects of pain. It is an essential book for anaesthetic trainees and is also an invaluable first reference for surgical and nursing staff, ICU

professionals, operating department practitioners, physiotherapists, psychologists, healthcare managers and researchers with a need for an overview of the key aspects of the topic.

This book covers all essential evidence on perioperative care and anesthetic concerns for cancer surgeries, including the evaluation and assessment of patients' schedule for cancer surgeries,

perioperative anesthetic management of various cancers, perioperative analgesia for cancer surgeries, and issues related to inoperable cancers. It reviews anesthetic considerations of all cancer types as there is a wide variation in anesthetic requirements in this subset of patients. Cancer surgeries are on the rise worldwide and healthcare facilities with cancer as a core specialty are emerging quickly around the globe. As cancer is on rise and efficient surgical

management is available, more and more patients are being treated surgically. However, cancer surgeries are complicated, have varied concerns and these are not covered sufficiently in presently available textbooks of anesthesiology. This book fulfills the growing need for complete and comprehensive textbook of onco-anesthesia and fills the gap in the current texts that do not exclusively cover anesthesia for cancer surgeries. This textbook

serves as a comprehensive but quick guide for trainee residents/fellows and practicing anesthesiologists, clinicians and surgeons.

The Difficult Airway provides a comprehensive textual and visual coverage of how to deal with patients who have expected or unexpected difficult airways. The text begins with a description of the incidence and importance of the difficult airway and then describes the ASA Difficult Airway Algorithm created to

facilitate the management of “difficult airways.” The majority of the book features a comprehensive step-by-step approach to the rescue techniques listed as part of the ASA Algorithm. Noted experts in each of the techniques have been recruited by the book editors to present the information. Figures throughout the book illustrate important points and procedures. This is a wonderful resource for professionals in the health care field including anesthesiologists,

intensive care physicians, emergency room physicians, nurses, and out-of-hospital first responders.

Core Cases in Critical Care CRC Press
 Like other titles in the Core Topics series, this book provides an easy-to-read introduction to this important topic that will

be of value to a wide spectrum of healthcare professionals including anaesthetists, intensivists, ODPs, theatre and recovery nurses. Concise but comprehensive chapters from experts in the field cover everything from basic anatomy, physiology and applied physics, through the various methods of maintaining the airway under anaesthesia (supraglottic devices, tracheal intubation, tubes/cuffs, endobronchial and double-lumen tubes) to the problem airway

(obstruction by infection, tumour or a foreign body, ENT and maxillo-facial surgery, aspiration, obstetrics, trauma, cervical spine disease, intensive care, the 'lost' airway, extubation and recovery), the paediatric airway, disinfection and cleaning of equipment and finally morbidity, mortality and medico-legal issues. 'Real' clinical scenarios, with patient management questions and model answers, are included throughout the book to bring to life some of the key problems

encountered in day-to-day practice. *Core Topics in Airway Management* CRC Press Written by leading social psychologists with expertise in leadership, health and emergency behaviour – who have also played an important role in advising governments on COVID-19 – this book provides a broad but integrated analysis of the psychology of COVID-19 It explores the response to COVID-19 through the lens of social identity theory, drawing from insights provided by four

decades of research. Starting from the premise that an effective response to the pandemic depends upon people coming together and supporting each other as members of a common community, the book helps us to understand emerging processes related to social (dis)connectedness, collective behaviour and the societal effects of COVID-19. In this it shows how psychological theory can help us better understand, and respond to, the events shaping the world in 2020.

Considering key topics such as:
 Leadership
 Communication
 Risk perception
 Social isolation
 Mental health
