This international handbook is essential for geotechnical engineers and engineering geologists responsible for designing and constructing piled foundations. It explains general principles and practice and details current types of pile, piling equipment and methods. It includes calculations of the resistance of piles to compressive loads, pile group

Effective measurement of the composition and properties of petroleum is essential for its exploration, production, and

refining; however, new technologies and methodologies are not adequately documented in much of the current literature.

Analytical Methods in Petroleum Upstream Applications explores advances in the analytical methods and instrumentation that allow more accurate determination of the components, classes of compounds, properties, and features of petroleum and its fractions. Recognized experts explore a host of topics, including: A petroleum molecular composition continuity model as a context for other analytical measurements A modern modular sampling system for use in the lab or the process area to collect and control samples for subsequent analysis The importance of oil-in-water measurements and monitoring The chemical and physical properties of heavy oils, their fractions, and products from their upgrading Analytical measurements using gas chromatography

and nuclear magnetic resonance (NMR) applications Asphaltene and heavy ends analysis Chemometrics and modeling approaches for understanding petroleum composition and properties to improve upstream, midstream, and downstream operations Due to the renaissance of gas and oil production in North America, interest has grown in analytical methods for a wide range of applications. The understanding provided in this text is designed to help chemists, geologists, and chemical and petroleum engineers make more accurate estimates of the crude value to specific refinery configurations, providing insight into optimum development and extraction schemes.

Written by a world-renowned theoretical physicist, *Introduction to Statistical Physics, Second Edition* clarifies the properties of matter collectively in terms of the physical laws governing atomic motion. This second edition expands upon the original to include many additional exercises and more pedagogically oriented discussions that fully explain the concepts and applications. The book first covers the classical ensembles of statistical mechanics and stochastic processes, including Brownian motion, probability theory, and the Fokker-Planck and Langevin equations. To

illustrate the use of statistical methods beyond the theory of matter, the author discusses entropy in information theory, Brownian motion in the stock market, and the Monte Carlo method in computer simulations. The next several chapters emphasize the difference between quantum mechanics and classical mechanics—the quantum phase. Applications covered include Fermi statistics and semiconductors and Bose statistics and Bose-Einstein condensation. The book concludes with advanced topics, focusing on the Ginsburg-Landau theory of the order parameter and the special kind of quantum order found in superfluidity and superconductivity. Assuming some background knowledge of classical and quantum physics, this textbook thoroughly familiarizes advanced undergraduate students with the different aspects of statistical physics. This updated edition continues to provide the tools needed to understand and work with random processes.

Oracy is a subject currently undergoing examination, due to the emphasis placed upon it by the National Curriculum. With an emphasis on practice, but embracing the major theoretical issues involved, this book contains numerous exercises, examining the issues surrounding oracy in schools. It describes the many ways in which teachers can encourage pupils to talk, using picture books, media-based discussions and English as a second language.

Pile ou Face décrit les lois mathématiques que l'on doit observer quand on répète des expériences aléatoires, comme dans les jeux de hasard. Cet opuscule est une introduction au calcul des probabilités, qui est aujourd'hui une branche importante des mathématiques. Le niveau requis pour aborder Pile ou Face est celui du cours d'analyse des deux premières années universitaires (ou des classes préparatoires scientifiques). Ce petit livre s'adresse aux étudiants désirant aborder le calcul des probabilités, aux futurs et actuels enseignants de mathématiques, mais aussi aux esprits curieux car le sujet traité allie utilité et esthétique. Après une introduction rapide au formalisme du calcul des probabilités, les principaux " théorèmes limites " sont énoncés et démontés, dans le cadre restreint mais déjà riche du jeu de pile ou face. On trouvera les attendues " lois des grands nombres ", le " théorème limite central ", la précise " loi du logarithme itéré ", ainsi que les estimations des grands écarts, les lois d'arcsinus et l'étude de la récurrence des marches aléatoires, suivant leur dimension.

Une introduction à la biostatistique, 2e édition CRC Press

A PRACTICAL HANDBOOK of card magic that brings together material from the same authors previous books on the subject augmented with additional information. It includes not only detailed descriptions of the tricks of three complete routines but also clear instructions on their performance. The effects can be produced without any sleights-of-hand and with a minimum of manipulation of the cards and all the handling required is fully explained.

Industrial Cutting of Textile Materials, Second Edition, is a comprehensive guide to cutting room operations, offering step-by-step information on processes, technologies and best practice. This new edition is updated to present the latest advances in automated cutting technology, including advanced spreading methods and machines, advanced knife cutting systems, and pattern matching methods processing garment, home and technical textiles. Drawing on her extensive practical experience, the author begins by reviewing initial steps, such as unloading, sorting and quality control of materials, before discussing subsequent operations, including lay planning and marker making, manual and automated spreading and cutting, fusing of cut components, and final work operations such as sorting cut components for further joining. The book also covers manual and advanced automated marker making, spreading and cutting methods for more intricate fabrics, such as striped fabrics and fabrics with check, motif and border patterns, narrow lace and

fabrics with pile. With essential information on cutting room operations and best practice, this book provides engineers, technologists and managers with the knowledge they need to maximize accuracy and efficiency, to control production processes effectively, and to improve product quality. The book also enables academics and students engaged in the field of textile and clothing technology to gain a solid understanding of cutting room procedures. Provides production managers, technologists, and other manufacturing specialists of textile goods the knowledge they need in order to increase raw material utilization and with it reduce productions costs, maximise cutting process efficiency, control production processes effectively, and improve ready product quality. Describes spreading and cutting of garment, home and technical textiles Includes guidance on best practice dealing with intricate fabrics Enables readers to benefit from the latest advances in automated textile cutting technologies

Since 1972, scientists from all over the world working on fundamental questions of echinoderm biology and palaeontology have conferred every three years to exchange current views and results. The 11th International Echinoderm Conference held at the University of Munich, Germany, from 6-10 October 2003, continued this tradition. This volume comprises 95

submitted papers and 96 abstracts covering a wide spectrum from innovative student contributions to the lessons learnt from experienced specialists. The content of the contributions ranges from original research results to the latest synopses concerning a variety of topics, including visual sensing, larval cloning, mutable collagenous tissues, sea urchin aqua-culture, deuterostome phylogeny, palaeobiology and taphonomy.
