The rapid conversion of land to urban and suburban areas has profoundly altered how water flows during and following storm events, putting higher volumes of water and more pollutants into the nation's rivers, lakes, and estuaries. These changes have degraded water quality and

habitat in virtually every urban stream system. The Clean Water Act regulatory framework for addressing sewage and industrial wastes is not well suited to the more difficult problem of stormwater discharges. This book calls for an entirely new permitting structure that would put authority and accountability for stormwater discharges at the municipal level. A number of additional actions, such as conserving natural areas, reducing hard surface cover (e.g., roads and parking lots), and retrofitting urban areas with features that hold and treat stormwater,

are recommended.

It covers the full range of embryo and fetal pathology, from point of death, autopsy and ultrasound, through specific syndromes, intrauterine problems, organ

and system defects to multiple births and conjoined twins. Gross pathologic findings are correlated with sonographic features in order that the reader may confirm visually the diagnosis of congenital abnormalities for all organ systems. Obstetricians, perinatologists, neonatologists, geneticists, anatomic pathologists, and all practitioners of maternal-fetal medicine will find this atlas an invaluable resource.

The dry forests and woodlands of Sub-Saharan Africa are major ecosystems, with a broad range of strong economic and cultural incentives for keeping them intact. However, few people are aware of their importance, compared to tropical rainforests, despite them being home to more than half of the continent's population. This unique book brings together scientific knowledge on this topic from East, West, and Southern Africa and describes the relationships between forests, woodlands, people and their livelihoods. Dry forest is defined as vegetation dominated by woody plants, primarily trees, the canopy of which

covers more than 10 per cent of the ground surface, occurring in climates with a dry season of three months or more. This broad definition - wider than those used by many authors - incorporates vegetation types commonly termed woodland, shrubland, thicket, savanna, wooded grassland, as well as dry forest in its strict sense. The book provides a comparative analysis of management experiences from the different geographic regions, emphasizing the need to balance the utilization of dry forests and woodland products between current and future human needs. Further, the book explores the techniques and strategies that can be deployed to improve the management of African dry forests and woodlands for the benefit of all, but more importantly, the communities that live off these vegetation formations. Thus, the book lays a foundation for improving the management of dry forests and woodlands for the wide range of products and services they provide.

The Morgan Stanley and d&a European Technology Atlas 2005 d&a hi-tech information Ltd.

It was believed that September 11th would

make certain kinds of films obsolete, such as action thrillers crackling with explosions or high-casualty blockbusters where the hero escapes unscathed. While the production of these films did ebb, the full impact of the attacks on Hollywood's creative output is still taking shape. Did 9/11 force filmmakers and screenwriters to find new methods of storytelling? What kinds of movies have been made in response to 9/11, and are they factual? Is it even possible to practice poetic license with such a devastating, broadly felt tragedy? Stephen Prince is the first scholar to trace the effect of 9/11 on the making of American film. From documentaries like *Fahrenheit 9/11* (2004) to zombie flicks, and from fictional narratives such as *The Kingdom* (2007) to Mike Nichols's *Charlie Wilson's War* (2007), Prince evaluates the extent to which filmmakers have exploited, explained, understood, or interpreted the attacks and the Iraq War that followed, including incidents at Abu Ghraib. He begins with pre-9/11 depictions of terrorism, such as Alfred Hitchcock's *Sabotage* (1936), and follows with studio and independent films that directly respond to 9/11. He considers

documentary portraits and conspiracy films, as well as serial television shows (most notably Fox's 24) and made-for-TV movies that re-present the attacks in a broader, more intimate way. Ultimately Prince finds that in these triumphs and failures an exciting new era of American filmmaking has taken shape.

Includes more than 100 maps, plans and illustrations. "This monograph is more than the story of Marine expeditionary operations in Afghanistan. It describes who our nation's enemies are; how America became involved in the Global War on Terrorism; and how the Marine Corps struggled to acquire a major role in Operation Enduring Freedom, as well as the actions of Marines and sailors who helped prosecute the air and ground campaigns against Taliban and al-Qaeda forces."— Dr. Charles P. Neimeyer, Director of Marine Corps History

The defense debate tends to treat Afghanistan as either a revolution or a fluke: either the "Afghan Model" of special

operations forces (SOF) plus precision munitions plus an indigenous ally is a widely applicable template for American defense planning, or it is a nonreplicable product of local idiosyncrasies. In fact, it is neither. The Afghan campaign of last fall and winter was actually much closer to a typical 20th century mid-intensity conflict, albeit one with unusually heavy fire support for one side. And this view has very different implications than either proponents or skeptics of the Afghan Model now claim. Afghan Model skeptics often point to Afghanistan's unusual culture of defection or the Taliban's poor skill or motivation as grounds for doubting the war's relevance to the future. Afghanistan's culture is certainly unusual, and there were many defections. The great bulk, however, occurred after the military tide had turned not before-hand. They were effects, not causes. The Afghan Taliban were surely unskilled and ill-motivated. The non-Afghan al Qaeda, however, have proven resolute and capable fighters. Their host's collapse was not attributable to any al Qaeda shortage of commitment or training. Afghan Model proponents, by contrast, credit precision

weapons with annihilating enemies at a distance before they could close with our commandos or indigenous allies. Hence the model's broad utility: with SOF-directed bombs doing the real killing, even ragtag local militias will suffice as allies. All they need do is screen U.S. commandos from the occasional hostile survivor and occupy the abandoned ground thereafter. Yet the actual fighting in Afghanistan involved substantial close combat. Al Qaeda counterattackers closed, unseen, to pointblank range of friendly forces in battles at Highway 4 and Sayed Slim Kalay.

This volume brings together many of the leading international figures in development studies, such as Jose Antonio Ocampo, Paul Krugman, Dani Rodrik, Joseph Stiglitz, Daniel Cohen, Olivier Blanchard, Deepak Nayyar and John Williamson to reconsider and propose alternative development policies to the Washington Consensus. Covering a wide range of issues from macro-stabilization to trade and the future of global governance, this important volume makes a real contribution to this important and ongoing debate. The volume begins by introducing the Washington Consensus, discussing how it was originally formulated, what it left out, and how it was later interpreted, and sets the stage for a formulation of a new development framework in the post-Washington Consensus era. It then goes on to analyze and offer differing perspectives and potential solutions to a number of key development issues, some

which were addressed by the Washington Consensus and others which were not. The volume concludes by looking toward formulating new policy frameworks and offers possible reforms to the current system of global governance.

Making Markets for Vaccines World Bank Publications

The concern for the fast-disappearing language stocks of the world has arisen particularly in the past decade, as a result of the impact of globalization. This book appears as an answer to a felt need: to catalogue and describe those languages, making up the vast majority of the world's six thousand or more distinct tongues, which are in danger of disappearing within the next few decades. Endangerment is a complex issue, and the reasons why so many of the world's smaller, less empowered languages are not being passed on to future generations today are discussed in the book's introduction. The introduction is followed by regional sections, each authored by a notable specialist, combining to provide a

comprehensive listing of every language which, by the criteria of endangerment set out in the introduction, is likely to disappear within the next few decades. These languages make up ninety per cent of the world's remaining language stocks. Each regional section comprises an introduction that deals with problems of language preservation peculiar to the area, surveys of known extinct languages, and problems of classification. The introduction is followed by a list of all known languages within the region, endangered or not, arranged by genetic affiliation, with endangered and extinct languages marked. This listing is followed by entries in alphabetical order covering each language listed as endangered. Useful maps are provided to pinpoint the more complex clusters of smaller languages in every region of the world. The Encyclopedia therefore provides in a single resource: expert analysis of the current language policy situation in every multilingual country and on every continent, detailed descriptions of little-known languages from all over the world, and clear alphabetical entries, region by region, of all the world's languages

currently thought to be in danger of extinction. The Encyclopedia of the World's Endangered Languages will be a necessary addition to all academic linguistics collections and will be a useful resource for a range of readers with an interest in development studies, cultural heritage and international affairs.

In the summer of 1803, Thomas Jefferson sent Meriwether Lewis and William Clark on a journey to establish an American presence in a land of unqualified natural resources and riches. Is it fitting that, on the 200th anniversary of that expedition, the United States, together with international partners, should embark on another journey of exploration in a vastly more extensive region of remarkable potential for discovery. Although the oceans cover more than 70 percent of our planet's surface, much of the ocean has been investigated in only a cursory sense, and many areas have not been investigated at all. *Exploration of the Seas* assesses the feasibility and potential value of implementing a major, coordinated, international program of ocean exploration and discovery. The study committee surveys national and international ocean programs and strategies for cooperation

between governments, institutions, and ocean scientists and explorers, identifying strengths, weaknesses, and gaps in these activities. Based primarily on existing documents, the committee summarizes priority areas for ocean research and exploration and examines existing plans for advancing ocean exploration and knowledge.

This World Bank report is a rich compilation of information on teaching learning materials (TLM) in Africa based on the extensive and multi-faceted

experience of the author's work in the education sector in Africa. The study examines a wide range of issues around TLM provision including curriculum, literacy and numeracy, language of instruction policy, procurement and distribution challenges, TLM development and production and their availability,

management and usage in schools. It also looks at the role of information and communication technology (ICT) based TLMs and their availability. The study recognizes that improved TLM system management is a critical component in achieving affordable and sustainable TLM provision for all students. This study, which draws from more than 40

Anglophone, Francophone, Lusophone, and Arabic-speaking countries will be particularly useful for policymakers, development partners, and other stakeholders attempting to understand the wide range of issues surrounding the complexity of textbook provision in Sub Saharan Africa.
