Excerpt from *Productive Soils: The Fundamentals of Successful Soil Management and Profitable Crop Production*; 235 Illustrations in the Text  
This course of study in the complete edition is designed to give it wide adaptation, to wit: (a) It may serve as a farmers' ready reference, or as a practical guide in successful soil management. (b) In college short courses, and normals, the whole course as it is planned may be given. The object of each student should be to master the fundamentals. (c) In college long courses, this text in the hand of the first- or second-year student may supply him with the fundamentals, leaving the lecture hour free to the instructor for elaboration, for application of facts and principles to local conditions, and for the presentation and discussion of experimental and research data. The subject of Soil Management and Crop Production is truly large enough and of sufficient importance to be given a place in every agricultural curriculum. This subject should precede or may be given at the same time as the allied subject, Farm Crops. The latter subject could then be made a study, not so much of soils in relation to growing the crops, but rather of crop characteristics, crop importance, types, varieties, judging of grains, seed production, special cultural methods, harvesting, and care of crops and grains. At the close of each chapter suggestions are offered for demonstrations, laboratory exercises, and for home experiments and projects. Many questions and practical problems are also given. The author wishes to express his appreciation to Prof. E. Truog of the Department of Soils, and to Prof. J. A. James of the Department of Agricultural Education, University of Wisconsin, for careful reading and approval of the manuscript; to Prof. E. R. Jones, University of Wisconsin, for verifying the chapters on water relations and drainage; to Prof. C. F. Marbut, in charge of soil survey, Bureau of Soils, United States Department of Agriculture, for valuable suggestions concerning soil types and for approval of that part of Chapter II relating to that subject. *Strategic Approach to Farming Success*  
Hardpress Publishing

Excerpt from *The Essentials of Agriculture*  
The American people have definitely decided that the public schools shall teach pupils to think and to do; that, so far as is consistent with a reasonably liberal culture, the training of the student shall relate intimately to the life he expects to lead. For a century and a half agriculture has been regarded by a few of the foremost educators as worthy of a place in our public schools, but it is only within the

last decade that the dream of these educators has approached realization. Agriculture, wherever well taught, has proved to be a source of strength to the school, whether a one-teacher country school, a high school, a college, or a university. In no way is it possible for the school to serve the local community more successfully than through instruction in agriculture. This may be best accomplished through the utilization of the facilities of the neighborhood as a laboratory. The gardens, orchards, and farms, and, indeed, the gardeners and farmers themselves, should be utilized to the fullest extent. By this means the school and the community are brought into the closest relations, and there is awakened among the farmers a lively interest in the work of the school. If the farmer is to support properly his own family and the two town families for whom he must provide food, he will need all the help that science can give. The way the two families in town will live is definitely related to the degree of skill with which the farmer tills his land and the degree of intelligence which the townspeople display in utilizing the farmer's products. This book is for students who desire a practical working knowledge of the essentials of agriculture. About the Publisher Forgotten Books publishes hundreds of thousands of rare and classic books. Excerpt from Complete Farmer's Guide: Fundamentals of Farming and Farm Life

While there have been great strides in recent years in the development of text-books on elementary agriculture, the best texts are still unsatisfactory in many ways. The defects complained of arise largely out of the fact that these texts are usually prepared by busy scientists who, though they may know agriculture, have made little study of the mental processes of children, have had little or no experience in teaching children, and are not very familiar with the exact conditions in the schools in which the texts are to be used. The result is that the subject-matter has not always been wisely chosen in the light of children's natural interests and needs, nor has the subject-matter that was chosen been organized in a careful, pedagogical manner, by starting always with the known, leading to the unknown through the known, and making the study a closely knit, coherent, living whole. Indeed, several of the texts are mere collections of articles on a dozen or more varied topics written by specialists in different institutions and without any common plan of organization or method of presentation. The children are not introduced gradually to the new technical terms, nor are proper apperceptive bases first laid before attempting to present the more complex processes of plant or animal growth.
