While all anesthetic and emergency drugs on the market are made for and administered to both adult and pediatric patients, their dosages and routes of administration are critically different. In the pediatric population, drug dosages are so specific, due to the child's small body mass index, that each drug given is calculated to their specific kilogram weight. *Pediatric Anesthesia and Emergency Drug Guide* is the first book that discusses and lists the milligram per kilogram dose range of each drug. Designed as a quick index, the anesthesia care provider for a 21 Kg child can simply open the book to the 21 Kg page, and see all the common anesthetic drugs already calculated both in milligrams and actual cc's to be drawn up for that specific weight, along with calculated intravenous fluids and endotracheal/LMA sizes as well as calculated emergency drugs, cardio-pulmonary resuscitation specific information including: chest compression to ventilation ratio, depth and rate of chest compression, synchronized cardioversion and defibrillation Joules, pulse check placement, and foreign body obstruction maneuvers.

Focused on pediatric physiology, pharmacology, pharmacokinetics and pharmacodynamics, this book illustrates the differences between the pediatric population and adults; knowledge of extreme importance not only during pediatric drug development but also in the clinical practice. Physicians, nurses, clinical pharmacologists, researchers and healthcare professionals will find this an invaluable resource. With the advent of pediatric exclusivity, and requirements to conduct clinical studies in children, an emphasis has been placed on finding a safe and efficacious dose of a drug in children. Children are not 'small adults', and drug dosing in this population requires special consideration. There are subtle physiological and biochemical differences among neonates, infants, children, adolescents and adults and dosing in pediatrics requires proper understanding of these factors. Furthermore, dosing in children, as in adults, should be based on pharmacokinetic and pharmacodynamic data. This is an evolving area, as pediatric pharmacokinetic studies are becoming mandatory for getting approval of new drugs in this population.
