Before the late 1980s, when the ideas of sustainability and sustainable development to the forefront of public debate, conventional, neo-classical economic thinking about development and growth had rarely given any consideration to the needs of future generations, or the sustainability of natural resource use.

Defining sustainability broadly as intergenerational fairness in the long-term decision making of a whole society, and using established economic concepts, this selection of refereed journal articles brings a famously ill-defined concept into sharp focus, providing academics at all levels with a formidable research tool. Spanning thirty years of the most important philosophical, theoretical and empirical contributions from both critics and defenders of neo-classical assumptions and methods of economic analysis, this focused collection of papers constitutes a unique, balanced resource on the full range of intellectual debates surrounding the economics of sustainability.

The purpose of this report is to produce a review on water resource valuation issues and techniques specifically for the appraisal and negotiation of raw (as opposed to bulk or retail) water resource allocation for agricultural development projects. The review considers raw water in naturally occurring water courses, lakes, wetlands, soil and aquifers, taking an ecosystem function perspective at a catchment scale, and takes account of the demands from irrigated and rainfed agriculture. It is hoped that the review will have particular application to developing countries where agreed methods for reconciling competing uses are often absent, but nevertheless takes account of valuation approaches that have been made in post industrial economies.
