Operative Solutions in Hepatobiliary and Pancreatic Surgery Beaux Books Publishing, LLC
This concise, accessible book covers anesthesia for hepatico-pancreatic-biliary (HPB) surgery and transplantation, based on randomized clinical trials, meta-analyses, case series, reports, and hands-on experience. The anatomy, physiology, pathophysiology and clinical consequences are discussed, and the close ties between HPB resection and transplant anesthesia are explored. The content reflects current real-world practice, as liver and pancreatic transplant surgeries have substantially improved in terms of blood-loss reduction, fast tracking and reduced risk. The book also addresses anesthetic aspects in connection with the recently introduced and rapidly expanding practice of laparoscopic surgery; with enhanced recovery; and with pancreatic surgery. Anesthesia for Hepatico-Pancreatic-Biliary Surgery and Transplantation is intended for aspiring HPB and transplant anesthesiologists, anesthesia trainees, and consultants with experience in HPB anesthesia who want to see whether or not they're up to date on the current standards.

This book explores the concept of prehabilitation to great depths using all possible modes of prehabilitation across surgical specialties. Prehabilitation is a unique concept that is becoming popular day-by-day. It began from the enhanced recovery after surgery (ERAS) program and has found importance in almost all of the surgeries now. The book possibly being the first on prehabilitation globally introduces the concept, describes the methods of functional assessment of the patients scheduled for extensive cancer surgery, and ways of pre-optimisation. It covers the methods of prehabilitation system-wise and then provides prehabilitation tools specific for individual onco-surgical subspecialties. The book will be an invaluable resource for practitioners of onco-anesthesia and onco-surgery in optimizing their patients before surgery for best results. It will also be useful for the allied disciplines such as nutritionists, physiotherapists, psychiatrists and oncology nurses.

Palliative Surgery John Wiley & Sons

This book comprises of experience in surgical gastroenterology, laparoscopy & hepatobiliary surgery-related mishaps, and complications that have arisen either out of variation in anatomy, variation in physiology or error of human judgment. Every textbook, literature or the research paper is usually directed towards a guideline or standard management protocol for particular disease or problem and most of the time, we don't find significant literature to combat the real-life situation of dealing with complications, especially which are not described in standard text books. If you learn from the experience of a learned person, then you don't need to experiment with everything on your own. So, the editors in this book have tried to compile their cases based experience and its management for the benefit of residents, fellow surgeon, and consultant. Along with the case-based learning, video links of standard GI surgery cases are also given.

This volume thoroughly describes the fundamentals of a new multidisciplinary field of study that aims to deepen our understanding of the human body by combining medical image processing, mathematical analysis, and artificial intelligence. Multidisciplinary Computational Anatomy (MCA) offers an advanced diagnosis and therapeutic navigation system to help detect or predict human health problems from the micro-level to macro-level using a four-dimensional, dynamic approach to human anatomy: space, time, function, and pathology. Applying this dynamic and "living" approach in the clinical setting will promote better planning for - and more accurate, effective, and safe implementation of - medical management. Multidisciplinary Computational Anatomy will appeal not only to clinicians but also to a wide readership in various scientific fields such as basic science, engineering, image processing, and biomedical engineering. All chapters were written by respected specialists and feature abundant color illustrations. Hepatopancreatoduodenectomy (HPD) is a radical new surgical procedure developed in Japan to treat patients with biliary tract carcinoma. The development and clinical application of HPD have been made possible through research conducted primarily by Japanese investigators on common routes of the spread of biliary tract carcinoma. Still regarded as a radical procedure because of its technical difficulty and possible complications, HPD is not yet widely practiced anywhere in the world. The authors of this volume, who are pioneers in the field, are convinced that recent progress in health-care technology will make HPD a safer and more commonly accepted procedure in the near future. The book is designed to share the experience of Japanese researchers with those working in the field throughout the world. The contents include a review of the historical development of HPD in Japan, indications and conditions for HPD, perioperative examinations, and patient management. Also presented are practical aspects of surgical technique and countermeasures against postoperative complications.
