Food Structure—Its Creation and Evaluation reviews research and major developments with regard to the role of ingredients in building food structures.

Emphasis is on homogeneous and heterogeneous multicomponent systems, their molecular interactions, the macroscopic physics of their mechanical properties, and the variety of techniques and strategies necessary to evaluate their properties if they are to be acceptable to the consumer. This book is comprised of 26 chapters and begins by discussing the relevance of food structure from a dental clinical perspective. The next chapter describes a hierarchy of gel structures that may be used to model the complex molecular networks formed by the protein and/or polysaccharide components within the food system, including simple single component networks, binary networks or mixed gels, and composite or filled gels. The reader is then introduced to the gel structure of food biopolymers; the structure and stability of emulsions; the polymer/water relationship and its importance for food structure; and the fracture properties of polymers. Dry spinning of milk proteins is also considered, along with structured fat and sugar systems, food crispness and texture. This monograph will be of interest to food scientists, sensory scientists, nutritionists, rheologists, physicists, and chemists.

Intended for students of intermediate organic chemistry, this text shows how to write a reasonable mechanism for an organic chemical transformation. The discussion is organized by types of mechanisms and the conditions under which the reaction is executed, rather than by the overall reaction as is the case in most textbooks. Each chapter discusses common mechanistic pathways and suggests practical tips for drawing them. Worked problems are included in the discussion of each mechanism, and "common error alerts" are scattered throughout the text to warn readers about pitfalls and misconceptions that bedevil students. Each chapter is capped by a large problem set.
