Recent advances in technology such as cloud computing, recent industry standards such as RFID, bibliographic standards like RDA and BIBFRAME, the increased adoption of open source integrated library systems (ILS), and continued shift in users' expectations have increased the complexity of the decision regarding ILS for all types of libraries. Recent advances in technology such as cloud computing, recent industry standards such as RFID, bibliographic standards like RDA and BIBFRAME, the increased adoption of open source integrated library systems (ILS), and continued shift in users' expectations have increased the complexity of the decision regarding ILS for all types of libraries. In a complete re-envisioning of the previous edition, *Automating Media Centers and Small Libraries: A Microcomputer-Based Approach*, Dania Bilal conceptualizes library automation in the Library Automation Life

Cycle (LALC) that is informed by the systems development lifecycle (SDLC). She explains how the next-generation discovery services supported in the library services platforms (LSPs) provide a single point of access to library content in all types and formats, thereby offering a unified solution to managing library operations. The book covers methods of analyzing user requirements, describes how to structure these requirements in RFPs, and details proprietary and open-source integrated library systems (ILSs) and LSPs for school, public, special, and academic libraries. Up-to-date information is provided about ILS software installation and testing, software and hardware architecture such as single- and multi-tenant SaaS and PaaS and IaaS, and usability assessment strategies for evaluating the ILS or LSP. The author concludes by describing what is likely coming next in the library automation arena.

Complete Web Applications Using PHP and MySQL PHI Learning Pvt. Ltd.

Discover how—with relatively straightforward scripts and minimal coding—to customize the user interfaces to third-party systems from your library's website for better communication with your users and to lead them to your library's services. In order to provide access to online resources, libraries depend on third-party vendor software that comes with each product. While these systems do have value, they can also be confusing, awkward, frustrating, or even misleading for library users. Imagine how much better your patrons' user experience would be if the software were customized specifically to fit your library. This how-to guide shows library staff how to take a DIY approach to customize the web interface to vendor-hosted online systems, thereby resolving usability problems and providing the ability to respond quickly to problems or evolving needs. The book begins with an explanation of how to test library vendor software for user experience, then goes on to present solutions to common usability problems through tutorials and case studies on using JavaScript or jQuery to change how a web browser displays that software. It also covers ongoing assessment methods to ensure that user needs have been satisfied. By using these tools, libraries can take some control of "black box" library software and customize it based on local needs.
